

Deployment Guide

This deployment guide is to help get your switch cluster up and running using PICA8's Cluster Configurator application. There are 6 CC deployment topologies documented in this deployment guide.

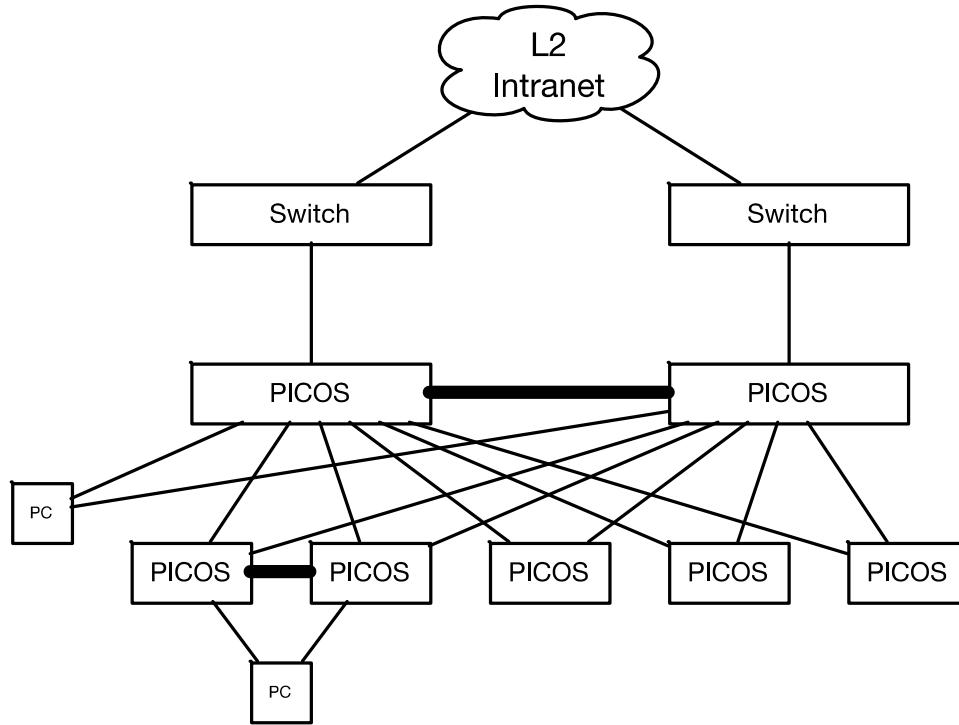

Two each of:

- L2 to L2
- L2 to L3
- L3 to L3

These configurations map to the Switch Cluster and upstream network topologies documented at the end of this document. Please customize them appropriately for your specific installation.

The QoS common configurations are documented separately under the QoS section.

L2 to L2 Topologies

L2 to L2 Topo #1

Description

External only VLANs

VLAN 10 - mgmt

External and Cluster VLANs

VLAN 11 - data

VLAN 12 - voice

Upstream: multiple topologies, some create topology loops and let STP protocols handle them.

CC-) setup init 1-6

```
manage_license install peer
```

```
switch_reinit peer
```

```
manage_license install self
```

```
switch_reinit self
```

```
manage_license install 1 .. 6
```

```
switch_reinit 1-6
```

CC-) setup net

Please wait few seconds ...

Please enter a blank space to erase configured values.

Please enter the Uplink Ports, e.g. te-1/1/48 () te-1/1/48

Please enter the Mgmt Vlan ID():10

L2 to L2 Topologies #2

L2 to L2 Topo #2

Description

External only VLANs

VLAN 10 - mgmt

External and Cluster VLANs

VLAN 11 - data

VLAN 12 - voice

Upstream: connection to upstream switches is using a LAG that eliminates the requirement for STP and utilizes all uplinks distributing traffic flows across them.

L2 to L3 Topologies #1

L2 to L3 Topo #1

Description

External only VLANs

VLAN 20 - mgmt

External and Cluster VLANs

VLAN 21 - data

VLAN 22 - voice

Upstream: connection to upstream network is over trunks connected to aggregation switches which connect to core routers. There are no L2 loops in the topology and the routers run their VRRP/HSRP sessions for VLAN 20 over the LAG link between the spines.

L3 to L3 Topologies #1

L3 to L3 Topo #1

Description

External only VLANs

VLAN 20 - mgmt

VLAN 21 - data

VLAN 22 - voice

Cluster only VLANs with VRRP VIPs and DHCP relay to upstream DHCP server

VLANs 2101, 2102 - data

VLANs 2201, 2202 - voice

OSPF routing on spines

Upstream: connection to upstream network is over trunks connected to aggregation switches which connect to core routers. There are no L2 loops in the topology and the routers run their VRRP/HSRP sessions for VLAN 20, 21 and 22 over the LAG link between the spines.

The upstream routers learn of the 2101, 2102, 2201, 2202 networks via OSPF updates.

L3 to L3 Topologies #2

L3 to L3 Topo #2

Description

External only VLANs

VLAN 30 - mgmt

VLAN 31 - data

VLAN 32 - voice

Cluster only VLANs with VRRP VIPs and DHCP relay to upstream DHCP server

VLANs 2101, 2102 - data

VLANs 2201, 2202 - voice

OSPF routing on spines

Upstream: connection to upstream network is over trunks connected to sub-interfaces on the routers. There are no L2 loops in the topology and the routers run their VRRP/HSRP sessions for VLAN 30, 31 and 32 over the LAG link between the spines.

The upstream routers learn of the 2101, 2102, 2201, 2202 networks via OSPF updates.

```

Physical Topology

Notes:

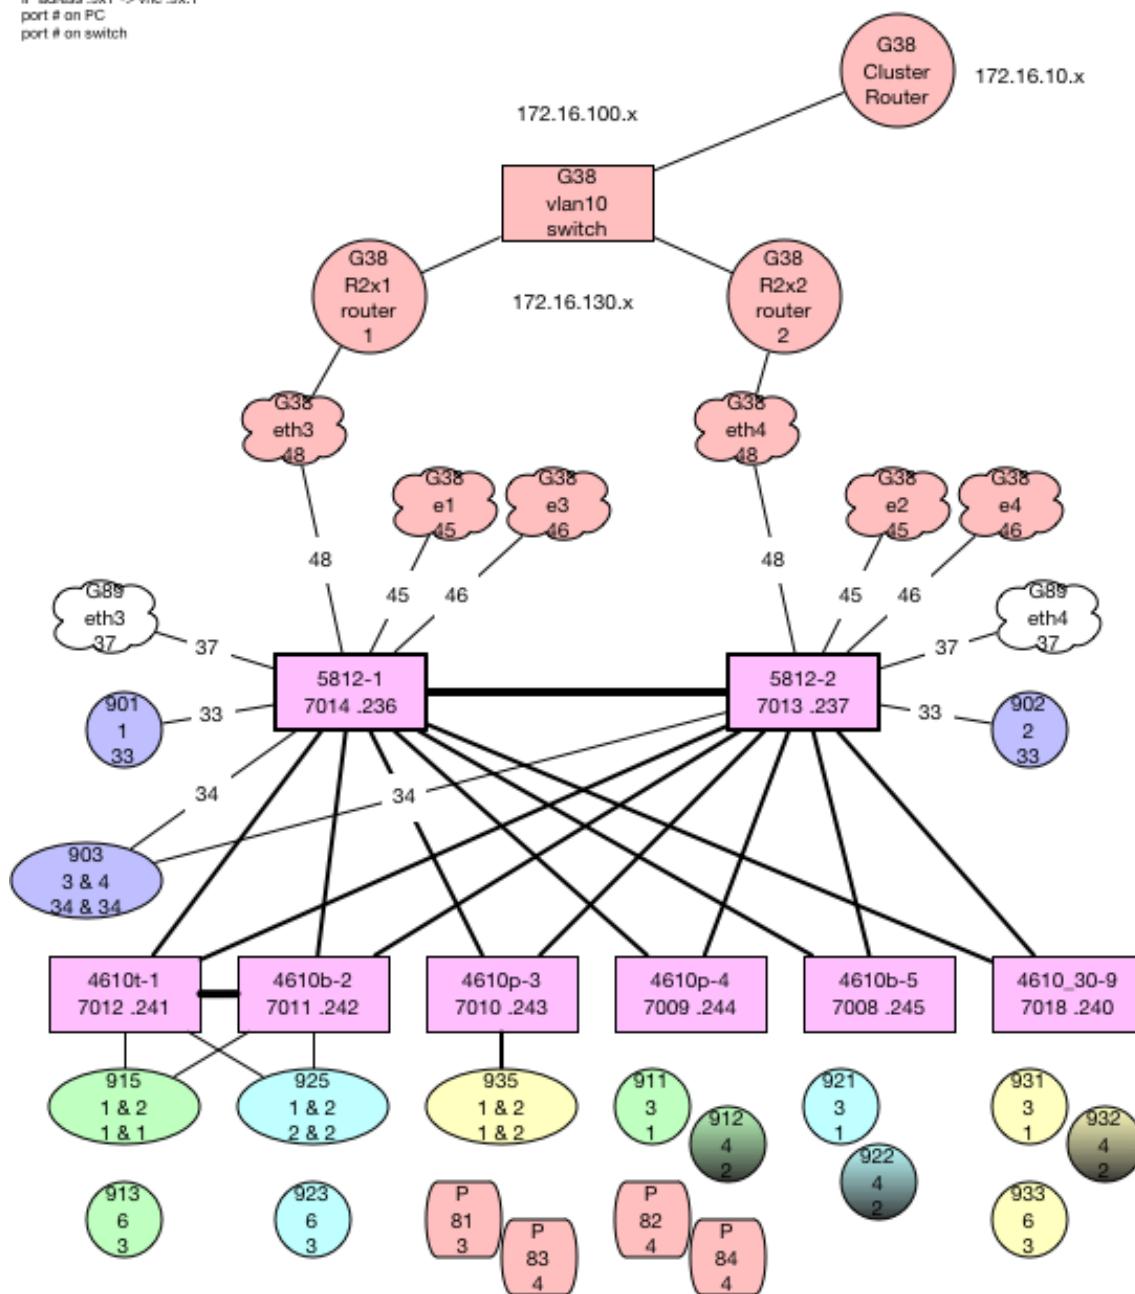

IP subnet - 172.16.0.

Terminal Server - 172.16.0.19
telnet port 70xx

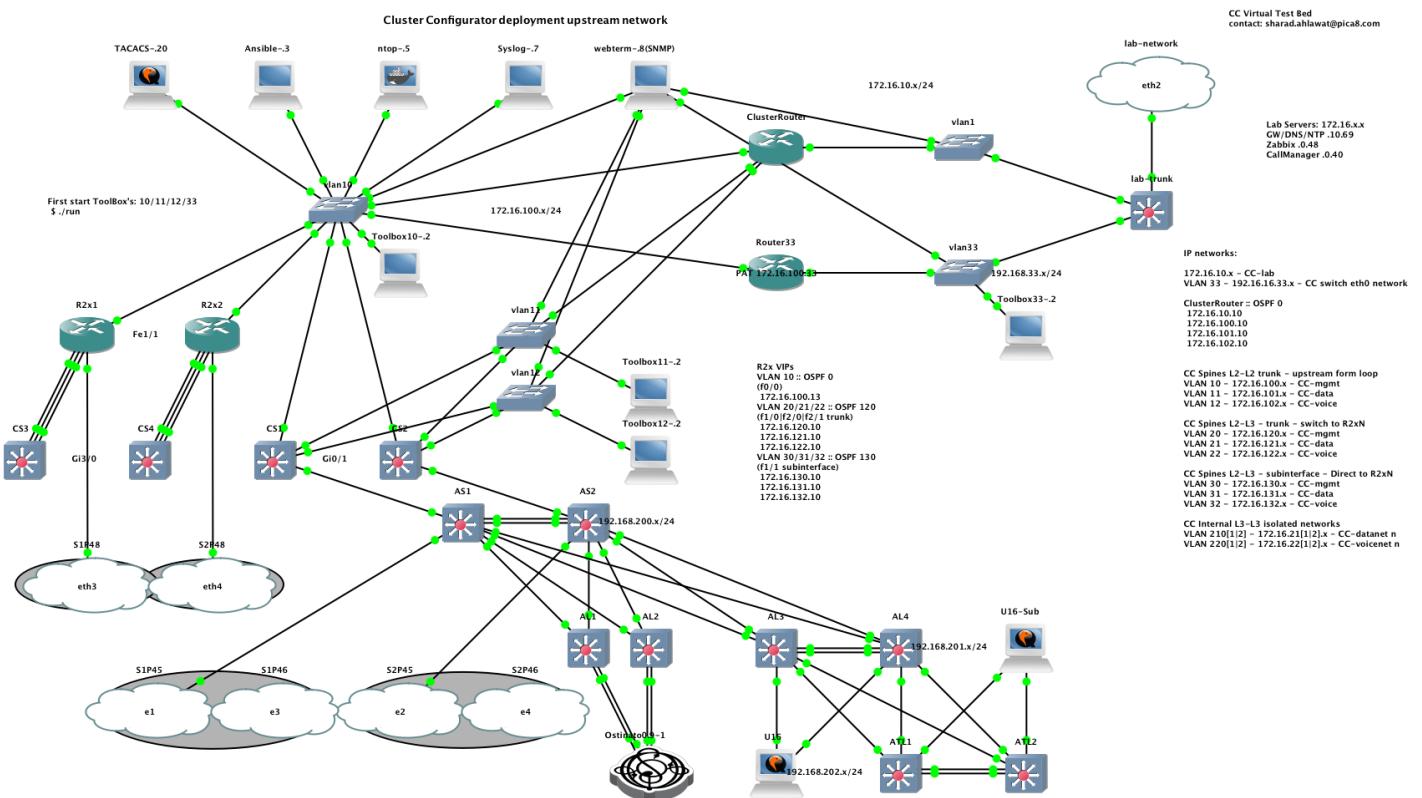

IP address .9xY -> vnc .9x:Y
port # on PC
port # on switch

CC Test Bed

contact: sharad.ahlawat@pica8.com

GNS3 Upstream Network Topology

Notes

ensure to not make configuration changes that are required to keep the ISL or other links operational - CC does not make configuration fool-proof

ae1 to ae16 are reserved for CC usage to map up to 16 leafs in the switch cluster

Tips

configuration

```

pre
  send "" configure
  showleafs
post
  send "" commit
  send "" exit
  showleafs
abort

```

```
send "" exit discard  
showleafs  
CC status  
send "" sudo service picos-cc status
```

SNMPwalk example

- o <http://snmplabs.com/snmpfwd/index.html>
- o snmpwalk -u cc-user -v 3 -n spine-1 172.16.100.100:1161
- o snmpwalk -u cc-user -v 3 -n leaf-1 172.16.100.100:1161
- o for traps we redirect via iptables on spines
 - iptables -t nat -vnL PREROUTING --line-number
 - tcpdump -i eth0 -n -s0 port 162 and udp
 - The SNMP trap server is configured as part of setup-mgmt
- o The SNMP walk user name configured as part of setup-mgmt is different from the SNMP user name configured in the CLI
